Environmental Health Analysis

Selected city: **Delhi**

Delhi

Delhi NGR - Very hard water, high TDS (CGWB)

112

MODERATE

Air Quality Impact

Lungs & Breathing

Moderate Risk

Breathing discomfort is likely for people with asthma, COPD, or allergies. Mild throat irritation and coughing possible for general population.

Sleep Quality

Moderate Risk

Airway inflammation can cause shallow breathing, snoring, or nighttime coughing — particularly with windows open.

Energy Levels

Moderate Risk

Reduced oxygen efficiency can contribute to a noticeable mid-day energy dip and mental fog.

Exercise Performance

Moderate Risk

High-intensity outdoor exercise increases inhalation of pollutants 2-3x; consider shifting cardio indoors or to early morning.

Long-Term Health

High Risk

Sustained exposure at this level is associated with increased risk of chronic bronchitis and reduced lung function over years.

Water Quality Impact

Hair Fall

High Risk

High mineral/TDS content is commonly associated with increased hair breakage and shedding with regular use.

Hair Dryness

High Risk

Hard water strips natural oils, often leaving hair dry, frizzy, and prone to tangling.

Scalp Health

High Risk

Mineral buildup can clog follicles and disrupt scalp pH, increasing dandruff and itchiness risk.

Skin Dryness

High Risk

Frequent exposure can compromise the skin barrier, leading to persistent dryness and flaking.

Acne

Moderate Risk

Mineral residue combined with sweat/oil can contribute to clogged pores and breakouts in acne-prone.

Sensitive Skin

High Risk

Sensitive skin types are at **minimally**.

Air Quality Score 72 / 100

Based on AQI 112 (Moderate). Derived from PM2.5 56 $\mu\text{g}/\text{m}^3$ and PM10 121 $\mu\text{g}/\text{m}^3$.

Water Quality Score 48 / 100

Very hard water, high TDS (CGWB).

Overall Environmental Score 62 / 100

Weighted: 60% Air Quality + 40% Water Quality. Moderate environmental burden — some lifestyle adjustments recommended.

Insights Panel

Top 3 Cleanest Cities

#1	Mumbai	58
#2	Pune	67
#3	Bangalore	72

Top 3 Most Polluted Cities

#1	Kanpur	117
#2	Kolkata	114
#3	Delhi	112

Biggest Anomaly

Kolkata records a higher overall AQI (114) than Delhi (112) — despite Delhi's PM_{2.5} (56 µg/m³) and PM₁₀ (121 µg/m³) being roughly 1.5–1.6x higher than Kolkata's (PM_{2.5} 38, PM₁₀ 75). This suggests other pollutants (e.g. NO₂, humidity-driven readings) are pushing Kolkata's composite AQI up independently of particulate load.

Most Surprising Observation

Kanpur (AQI 117) and Mumbai (AQI 58) differ by only 59 points — both currently sit in "Moderate"/"Satisfactory" territory rather than the "Severe" extremes often associated with Indian metros during winter months. This snapshot reflects a relatively favorable mid-year air quality period (pre-monsoon/monsoon transition), which typically suppresses particulate accumulation compared to the Oct–Jan peak pollution season. Coastal cities (Chennai & Mumbai) benefit most from this seasonal effect, posting the lowest AQI readings of the group.

Recommended Actions

- Residents of Kanpur and Delhi should monitor AQI daily, as seasonal shifts (especially Oct–Jan) can push readings into "Poor" or "Very Poor" territory rapidly.
- Cities with water scores below 55 (Delhi, Chennai, Kanpur) should prioritize filtered/softened water for hair and skin care routines.
- Even in "Moderate" AQI cities, sensitive groups (asthma, allergies, children, elderly) should keep N95 masks accessible for outdoor commutes.
- Track this dashboard seasonally — re-run the analysis in winter months to capture the full annual pollution range.

Personalized Recommendations

Daily Actions — Delhi

- ✓ Check live AQI each morning before planning outdoor time
- ✓ Wear an N95/N99 mask during commutes
- ✓ Stay hydrated — supports mucous membrane defense against particulates
- ✓ Time outdoor errands for early morning when pollution typically dips

Indoor Air Improvements

- ✓ Run a HEPA air purifier in bedrooms and living areas
- ✓ Add indoor plants (snake plant, areca palm) for marginal air filtering benefit
- ✓ Keep windows closed during peak traffic hours (8–10am, 6–9pm)
- ✓ Replace AC/purifier filters every 60–90 days

Outdoor Activity Guidance

- ✓ Moderate-intensity outdoor activity okay; avoid peak traffic hours
- ✓ Avoid exercising near high-traffic roads regardless of AQI
- ✓ Sensitive groups should carry a reliever inhaler if applicable

Hair-Care Recommendations

- ✓ Use a clarifying shampoo weekly to remove mineral buildup
- ✓ Apply a leave-in conditioner or hair oil before washing to form a protective barrier
- ✓ Rinse with filtered water for final rinse if hair fall is a concern
- ✓ Cover hair outdoors on high-AQI days to reduce particulate settling

Skin-Care Recommendations

- ✓ Double-cleanse in the evening to remove particulate buildup from skin
- ✓ Apply a barrier-repair moisturizer immediately after washing to counter hard-water dryness
- ✓ Use antioxidant serums (vitamin C/E) to help counter pollution-driven oxidative stress
- ✓ Patch-test new products if skin sensitivity increases with air quality changes

Water-Quality Improvement

- ✓ Install a shower filter or water softener to reduce mineral exposure
- ✓ Use an RO or multi-stage filter for drinking water regardless of city
- ✓ Descale shower heads and taps monthly in hard-water areas
- ✓ Test water hardness annually if symptoms (dryness, hair fall) persist

Executive Summary

This analysis covers 8 major Indian cities using the latest available AQI snapshot (Jun 13–14, 2026). The average AQI across all cities is 93 (Satisfactory), with Mumbai recording the lowest AQI at 58 (cleanest air) and Kanpur recording the highest at 117 (most polluted). Notably, the spread between the best and worst city is just 59 points — a relatively narrow band reflecting the favorable mid-year pollution season rather than peak winter conditions.

Coastal and southern cities (Chennai, Pune, Bangalore, Mumbai) consistently outperform northern/inland cities (Delhi, Kolkata, Kanpur, Ahmedabad) on both AQI and PM_{2.5}/PM₁₀ readings. Water quality scores range from 45/100 (Kanpur) to 68/100 (Pune), with hard-water cities showing elevated hair and skin risk grades regardless of air quality.

The average Environmental Health Score across all cities is 69/100 (Grade D). For the currently selected city (Delhi), the personal report card shows an overall score of 62/100. Residents across all cities are advised to monitor AQI daily, especially heading into the Oct–Jan high-pollution season, and to adopt water-quality precautions in cities with scores below 55/100.

City-Wise Snapshot

City	AQI	AQI Category	PM _{2.5} (µg/m ³)	PM ₁₀ (µg/m ³)	Water Quality (/100)	Water Hardness	Hair Risk (/100)	Skin Risk (/100)	Environmental Health Score (/100)
Kanpur	117	Moderate	61	122	45	Hard	78	72	58
