Build Your First Supply Chain

A **supply chain** is the entire journey a product takes before it reaches a customer — from raw materials, to suppliers, to factories, to warehouses, to trucks, ships, or planes, and finally to someone's doorstep. Every business that makes or sells physical products depends on one.

Every choice in a supply chain is a trade-off. Cheaper usually means slower or riskier. Faster usually means more expensive or less sustainable. There's rarely a single "correct" answer — only choices that fit a company's goals, budget, and customers.

In this simulation, you'll take charge of a randomly generated company and make five key supply chain decisions. After each one, we'll explain exactly what changed and why — so by the end, you'll understand the fundamentals of how real supply chains work.

FINAL REPORT

Nova Co. – Supply Chain Dashboard

Based on Cost, Delivery Speed, Risk, Customer Satisfaction, and Sustainability across all five decisions.

Strengths

Delivery Speed is a strong point of this supply chain.

Customer Satisfaction is a strong point of this supply chain.

Weaknesses

Cost needs attention in this setup.

Sustainability needs attention in this setup.

Biggest Risk

Your operating costs are high relative to your setup. If demand softens or competitors undercut your pricing, thin margins could quickly become a real problem.

Three Practical Improvements

1

Renegotiate contracts or consolidate shipping volumes to bring down per-unit transportation and storage costs.

2

Shift a portion of long-haul shipments from air to rail or sea freight, and audit suppliers for environmental standards.

3

Set up real-time tracking across your supply chain so disruptions can be caught and addressed earlier.

Live Business Metrics

Cost 86

Delivery Speed 98

Risk 23

Customer Satisfaction 86

Sustainability 31

Your Decisions Recap

CHOOSE YOUR SUPPLIER STRATEGY

Multiple Suppliers (3+)

CHOOSE YOUR FACTORY LOCATION

Nearshore (Neighboring Region)
